OBJECTIVE

To work as a backend developer, the part of the system that handles data and business rules, with emphasis on databases and solution design: understanding the problem, designing the system and following it through until it runs well day to day.

PROFILE

I am communicative and collaborative. I like bringing my own perspective to a problem, contributing in brainstorming conversations and disagreeing with respect and good arguments when I see a better path. I think outside the box and treat problems as puzzles: I prefer verifying over assuming, measure before changing and investigate every failure until I find the true cause, taking ownership of what I deliver from start to finish.

PROFESSIONAL SUMMARY

A developer who works across every stage of a system: understanding the need, organizing the data, building the logic, creating the screens and keeping everything running after delivery. My defining trait is technological flexibility. I have shipped production systems in the market's main technologies, such as Java, Angular and Python, and I adapt quickly to new tools because I master the fundamentals they all share.

In practice, I know how to structure large systems in an organized way, make different systems talk to each other (such as integrating a new product with an ERP the company already uses), protect sensitive data and ensure quality with automated tests. I also build and maintain my own products, live today, taking care of every part: server, release of new versions and monitoring.

PROFESSIONAL EXPERIENCE

TOTVS (agribusiness sector) · Mid-level Full Stack Developer (contractor) · Nov 2024 – present

I develop and maintain management systems for agribusiness companies, integrated with the TOTVS PIMS ERP, covering areas such as costs, cash flow, purchasing, suppliers, truck weighing and industrial production. The two product lines add up to about thirty services working together, built in Java (Spring Boot).

A large part of my work is making different systems talk to each other. I connect the products to SAP (contracts, invoices, weighings and costs), to other TOTVS systems, to a procurement platform and even to an industrial scale that sends truck weights straight into the system. For that I work with three databases at the same time (PostgreSQL, Oracle and SQL Server), taking care of data organization and query performance.

I also modernize older systems, rewriting them in current versions of the technologies without stopping the operation, and build the screens users work with (Angular). Every delivery goes through three environments (development, testing and production) with automated releases.

CNH Industrial · Project Management Intern · Jun 2022 – Jun 2024

Parts management in projects, from registration to supplier relations, automating controls and data analysis with macros and pivot tables.

Elring Klinger · Kaizen Intern · Mar 2022 – May 2022

Tracking of Kaizen requests and automation of report generation for several departments.

PERSONAL PROJECTS

Products I created from scratch and keep running live, taking care of every part: system, database, server and releases. I use AI assistants as support, always critically reviewing the result.

Monevas: personal finance and investment analysis (hmg.monevas.com)

A personal finance and investment analysis platform. It automatically collects data from the stock exchange and official bodies (B3 and CVM), keeps a history of nearly 9 million price records and helps evaluate stocks through five different methods. It has two-step login verification and encryption of sensitive data. Keeping it live taught me to diagnose and fix real server problems, such as memory exhaustion and silent component failures.

Lingua: language learning with spaced repetition

A language-study app that shows each word at the right moment to review, so the learner does not forget. It works on desktop and mobile, with synthesized voice audio and speech recognition. I calibrated the review method with simulations and rigorous testing: the final configuration retains 81% of vocabulary after one week, versus 7% for the worst configuration.

Monitorame: logistics for fleets, shipments, sensors and routes

A logistics system to manage fleets, deliveries, sensors and routes. It calculates the best path and stop order for vehicles and shows everything on interactive maps. Every code change goes through an automatic battery of tests, from the database to the screens, before being released.

Activity Manager: time tracking with AI classification (Linux)

A program that records how the user spends time on the computer and classifies activities automatically with AI. It was designed to protect privacy: the analysis happens on the user's own computer and the server never sees window contents.

Other projects

I also maintain: an academic portal with dashboards for students, teachers and institutions (23 screens); a desktop e-mail reader (Gmail and Outlook); a self-hosted family locator on a map; an extension published on the official VS Code marketplace; and analysis of public health data (DATASUS).

TECHNICAL SKILLS

Backend: Java (advanced) with Spring Boot 2/3, Spring Cloud (Gateway, Eureka, OpenFeign) and Spring Security (JWT, OAuth2); Python (FastAPI, Django REST); Node.js (Express, WebSockets); Go and Dart. Concepts: microservices, modular monoliths, domain events, messaging (RabbitMQ) and asynchronous processing, REST APIs, JPA/Hibernate.

Frontend and data: Angular 17–22 (PrimeNG, TailwindCSS, RxJS, SSR), Vue 3, Electron, Flutter and Capacitor; PostgreSQL (PostGIS), Oracle, SQL Server and DuckDB, with data modeling, query optimization and versioned migrations (Flyway).

Infrastructure, quality and AI: Docker/Compose, GitHub Actions, Linux/VPS, Nginx, Cloudflare Tunnel and Prometheus; JUnit, Testcontainers, Playwright and Vitest; LLM integration (Anthropic, OpenAI, Gemini) with structured output and RPA with Selenium.

EDUCATION

Computer Engineering · Escola de Engenharia de Piracicaba (EEP) · expected graduation: Dec 2026 (evening program).

LANGUAGES

Portuguese native. English advanced (Red Balloon, Cultura Inglesa and Wise Up).
